Patent No. 6316000
GENERAL INFORMATION:
APPLICANT: Williamson, Kim C.
APPLICANT: Kaslow, David C.
TITLE OF INVENTION:
TITLE OF INVENTION: fallciparum Transmission Blocking Target Antigen, Pfs230
NUMBER OF SEQUENCES: 4
CORRESPONDENCE ADDRESS:
ADDRESSEE: Townsend and Townsend and Crew LLP
STREEST: Two Embarcadero Center, Eighth Floor
CITY: San Francisco
STATE: California

(ftp://arthur.epm.ornl.gov/pub/xgrail), Genefinder (Phil Green, University of Washington), Genscan (Chris Burge, http://gnomic.stanford.edu/GENSCANW.html), and NetPlantGene (http://www.cbs.dtu.dk/services/NetGene2/), searches of the complete sequence against a peptide database and plant EST databases at TiGR, and manual curations based on those analyses. Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity, that are predicted by two or more gene prediction programs over most of their length are annotated as 'hypothetical' proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy.) Simple repeats were identified by repeatmasker (Arian Smit, http://genome.wustl.edu/edy/tRNAscan SE/). Simple repeats were indentified by repeatmasker (Arian Smit, http://ftp.genome.wusthington.edu/RM/RepeatMasker.html). Genes are numbered from the top to bottom of the chromosome.
```

CDS

F6P23, F5J6, T17A5, and T13L16, the ESSA group for sequencing clone F13D4, and Scott Jackson, Jiming Jiang, Klaus Meyer, Eric Richards and Satoshi Tabata for helpful assistance. In addition, we would show, Hanlf Rhalak, Michael E. Heaney, Lily Fu, Feng Liang, Jeremy Peterson, Michael Holmes, and Delwood Richardson for software and sequencing BAC clones thank the CSHL/WashU/ABI consortium for database support.

This work was supported by the National Science Foundation, Department of Energy and the US Department of Agriculture.

On Oct 12, 2000 this sequence version replaced gi:9967270. Genes were predicted from the integrated results of the following: GRNSCANI.0, BLASTRX.0, BLASTRX.2.0 as well as SplicePredictor (October 1988 version). The genomic sequence was searched against NCBI NonReduntant Protein database, nr. (ftp://ncbi.nlm.nih.gov/blast/db) and the cDNA sequence database at KRP. Protein homologies of the coding regions were searched against NCBI NonReduntant Protein database with BLASTRO.0, ESTS represent the identified CDNA sequences using BLASTN 2.0 with the corresponding DDBJ accession no. and RGP clone ID. A gene with identity or significant homology to a protein name to indicate the homology level such as same name, 'putative' and 'like protein'. A gene without significant homology to any protein name to indicate the homology (covering almost the entire length of partial sequence) is classified as an 'unknown' protein. A gene predicted with a gene prediction program is classified as a 'hypothetical' protein.

The orientation of the sequence is from T7 to SP6 of the PAC clone. This sequence of P0665D10 clone has an overlap with P0489609 (DDBJ: AP001633) clone attries at the position 1408672 of F05601. This sequence of this clone at the position 5406 to 134967 of 3' end. The sequence of this clone ends at the position 5406 to 134967 of 3' end. The appearance of P0665D10 clone has an overlap with P0489609 (DDBJ: AP002745) clone at the position 5406 to 134967 of 3' end. The appearance of P0665D10 clone has an overlap with p0489609 (DDBJ: AP002745) clone at the position 5406 to 134967 of 3' end. The appearance of this entry is available at the position 5406 to 134967 of 3' end. * NOTE: This is a 'working draft' sequence. It currently
* consists of 39 contigs. The true order of the pieces
* is not known and their order in this sequence record is
                                                                                                                                           * arbitrary. Gaps between the contigs are represented as * runs of N, but the exact sizes of the gaps are unknown. * This record will be updated with the finished sequence * as soon as it is available and the accession number will * be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  bp in length

This STS is part of a random genomic sequencing program of thirteen
yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces
exiguus, Saccharomyces servazzii, Zygoasccharomyces rouxii,
Saccharomyces kluyveri, Kluyveromyces thermotolerans, Kluyveromyces
lactis var. lactis, Kluyveromyces marxianus var. marxianus, pichia
angusta. Debaryomyces hansenii var. hansenii, pichia sorbitophila,
Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to
keywords for description of this sequence and for the sequence of
the other extremity of this insert.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ä

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B or or Complement encoding a polypeptide having a sequence at least 40% identical to Cor their combinations. Also included are an expression carsette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DMT of Industring sequence, DMT 3. flanking sequence or an 5. untranslated region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and sealecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the protein in a plant results in a delay in flowering time, introduction of the protein into a cell results in modulation of methylation of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. The polynucleotide is useful for detecting a nucleic acid in a sample. The prediction of target genes by demethylation. The present transcription of target genes by demethylation. The present invention relates to an isolated polynucleotide sequence or their υ or A,B specific homology to DEMETER domains English. complement encoding a polypeptide having a sequence at least 40% identical to DWT (DEWTER, previously known as ATROPOS (ATR)) Domain A, B or C or their combinations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DWT, a host cell comprising an exogenone or an S' untranslated region of DWT, a host cell comprising an exogenous polynucleotide encoding a DWT-like protein. The expression cassette is conducted encoding a DWT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the protein in a plant results in a medulation of methylation of the protein into a cell results in andulation of methylation of the protein in an Arabidopsis leaf results in expression of the MEDRA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. The polynucleotide is useful for detecting a nucleic acid in a sample. Demetric in the cell of sexults in expression of the MEDRA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. Sequence encodes a DMT protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ä

The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B or C or their combinations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DMT 5' flanking sequence, DMT 3' flanking sequence or an 5' untranslated region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein. The expression cassette is polynucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprising at polynucleotide encoding a boxt cell preferably Agrobacterium by sexual cross, and selecting a host cell preferably Agrobacterium by sexual cross, and selecting a host cell preferably Agrobacterium by sexual cross, and selecting in a heart cell with modulated transcription, where the protein in a plant results in a delay in flowering the protein in a plant results in anodulation of methylation of the protein into a cell results in modulation of expression of the plant results in an Arabiopses endosperm development and expression of the plant results in enhanced endosperm development and expression of the protein in a Arabiopsia leaf results in expression of the plant results in enhanced endosperm development and expression of the protein in a Arabiopsia leaf results in expression of the MEDEA agence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  a sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The polynucleotide is useful for detecting a nucleic acid in a sample. DEMETER is related to 5-methylcytosine glycosylases and regulates transcription of target genes by demethylation. The present sequence encodes a DMT protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               121 tgttctgctaaattttccagctgttacattttccgatcacgagaagaatcactgggtttt 180

The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B or C or their combinations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DMTs, a host cell comprising an exogenous polynucleotide comprising an exogenous polynucleotide comprising an exogenous polynucleotide comprising an exogenous polynucleotide comprising an expension cassette is polynucleotide encoding a DMT-like protein. The method comprises introducing a DMT-like protein. The method comprises introducing cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following protein in a plant results in a delay in flowering time, introduction of the protein into a cell results in modulation of methylation of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The protein in an Arabidopsis leaf results in expression of the MEDEA gene. The protein in an Arabidopsis leaf results in a nucleic acid in a sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    sedneuce

The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, E or C or their combinations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DMT 5' flanking sequence, DMT 3' flanking sequence or an 5' untranslated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  sedneuce

щ

region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein and a transgenic plant comprising a concoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following blological activities, which include enhanced expression of the protein in a plant results in a delay in flowering time, introduction of the protein into a cell results in addulation of methylation of chromosomal DNA in the cell, reduction of expression of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. DEMETER is related to 5-methylotycsine glycosylasses and regulates ó 5241 5361 5481 5661 5062 tcagaaaagatgtggagggaatgaagggagacaggaacgaaacaaaaacaatatgatt 5121 5181 5242 aagatcatggtggtatcgaccttgaatggttgagagaatctcctcctgataaagccaagg 5301 243 cagigotogagicoatocaaaaattiotitggocaagactitgoaaactogaicaacgaa 5541 cactgtatgaattacactaccaactgattacgtttggaaaggtatttgcacaaagagta 5601 ctagtgcaagacttgctttaccggcaccagaggagaggtgagcttaacaagtgcaactattc 5721 cggtccctcccgagtcctttcctcctgtagccatcccgatgatagaactacctcttccgt 5781 603 183 gatgggttcctctccaaccacttcctgagtccctgcagttgcatcttcttgaactgtatc 423 cgatccctagtgagggaaatgcagctgccgcattcaagcccatgctattacccccagagc 723 Gaps 63 184 gggatcatggaagtattgacctagaatggttgagagatgtggccccagacaaagcgaaag ccatagactatgaagcaataagacgtgctagtatcagcgagatttctgaggctatcaagg cattgaactacgaagcagtcagaagtgcagcagttaaagaaatttctgatgctattaagg aaagagggatgaataacatgttggccgtacgaattaaggatttcctagaacggatagtta 5422 gatgggtgcctctacaacccctacctgaatcacttcagttacacctcctggagctatacc 5602 gaccaaattgtaatgcatgtccaatgaggaggagagtgcagacactttgccagtgcttatg . 0 6.0%; Score 411.8; DB 24; Length 758; 72.9%; Pred. ```
The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B or C or their combinations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DMT 5' flanking sequence, DMT 3' flanking sequence or an 5' untranslated region of DMT. The protein and a transgenic plant comprising a computing a DMT-like protein. The expression cassette is cassette encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the control in a plant results in a delay in flowering time, introduction of the protein in a plant results in a modulation of methylation of the collowing plant results in expression of the mother companies. The protein in a plant results in modulation of expressing of the collowing plant results in expression of the protein in a practical modulation of expression of the protein in a plant results in modulation of expression of the protein in a practical plant results in expression of the protein in a practical plant results in expression of the protein in a practical plant results in expression of the protein in a practical plant results in expression of the protein in a practical plant results in expression of the protein in a practical plant results in expression of the protein in a plant results in expression of the protein in a plant results in expression of the protein in a plant results in expression of the protein in a plant results in expression of the protein in a plant results in expression of the protein in a plant results in expression of the protein in a plant results in expression of the protein in a plant results in expression of the protein in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polynucleotide that control plant development comprising a sequence having a specific homology to DEMETER domains A,B or C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The polynucleotide is useful for detecting a nucleic acid in a sample. DEMETER is related to 5-methylcytosine glycosylases and regulates

complement encoding a polymetrical having a sequence at least 40% identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B or or their combinations. Also included are an expression or or their combinations. Also included are an expression or or their combinations. Also included are an expression or or their combinations. Also included are an expression or DMT is a polymucleotide under the control of a promoter at least 70% identical to DMT 5' flanking sequence or an 5' untranslated region of DMT, a host cell comprision an exogenous polymucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell with modulated transcription, where the cassette into a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the protein in a plant results in a medulation of methylation of the protein in a plant results in modulation of expression of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polymucleotide is useful for detecting a nucleic acid in a sample. The Drivelicotide is useful for adetecting a nucleic acid in a sample. The Drivelicotide is useful for detecting a nucleic acid in a sample. The Drivelicotide is useful for demethylation. The present transcription of target genes by demethylation. The present transcription of sequence encodes a DMT-like protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

```
The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMPTER, previously known as ATROPOS (AFR)) Domain A, B or C or their combinations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DMT 5′ flanking sequence, DMT 3′ flanking sequence or an 5′ untranslated region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein and a transgenic plant comprising a concinct of the cassette into a host cell preferably Agrobacterium by sexual the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the protein in a plant results in a delay in flowering time, introduction of the protein in a plant results in a delay in flowering time, introduction of chromosomal DNA in the cell, reduction of expression of the protein in a Arabidopsis leaf results in expression of the protein in a Arabidopsis leaf results in expression of the protein in a Arabidopsis leaf results in expression of the protein in an Arabidopsis leaf results in expression of the protein in an Arabidopsis leaf results in expression of the DEMETER is related to 5-methylcytosine glycosylases and regulates

"The polynucleotide is useful for detecting a nucleic acid in a sample."

"The polynucleotide is useful for detecting a nucleic acid in a sample."

"The polynucleotide is useful for detecting a nucleic acid in a sample."

"The polynucleotide is but the present and expression of the protein protein and expression of the protein and expr

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DWT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B or C or their combinations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DWT 5' flanking sequence, DWT 3' flanking sequence or an 5' untranslated region of DWT. A host cell comprising an exogenous polynucleotide encoding a DWT-like protein and a transgenic plant comprising a polynucleotide encoding a DWT-like protein. The expression cassette is useful for modulating transcription. The method comprising a polynucleotide encoding a DWT-like protein. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell preferably Agrobacterium by sexual cross, and selecting in a least one of the following biological activities, which include enhanced expression of the protein in a plant results in adelay in flowering time, introduction of the protein into a cell results in modulation of methylation of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. Examples a power of the present contains a procession of the prevent and expression of the protein in an Arabidopsis leaf results in expression of the protein in an Arabidopsis leaf results in expression of the protein in a plant required to 5-methyloycosine glycosylasses and regulates and required to 5-methyloycosine glycosylasses and regulates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B or C or their combinations. Also included are an expression cassette comprising the polymucleotide or comprising a heterologous polymucleotide under the control of a promoter at least 70% identical to DMT 5' flanking sequence, DMT 3' flanking sequence or an 5' untranslated region of DMT, a host cell comprising an exogenous polymucleotide encoding a DMT-like protein and a transgenic plant comprising a polymucleotide encoding a DMT-like protein. The expression cassette is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    lynucleotide that control plant development comprising a sequence a specific homology to DEMETER domains A,B or {\tt C}

                                     cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the protein in a plant results in a delay in flowering time, introduction of the protein into a cell results in modulation of methylation of chromosomal DNA in the cell, reduction of expression of the protein in a plant results in enhanced endosperm development and expressing of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. DEMETER is related to 5-methylovtosine glycosylasses and requlates transcription of target genes by demethylation. The present
